Extract the content of the installation archive to a folder on your PC.

Next connect to your server using the FTP credentials your host provided you with.

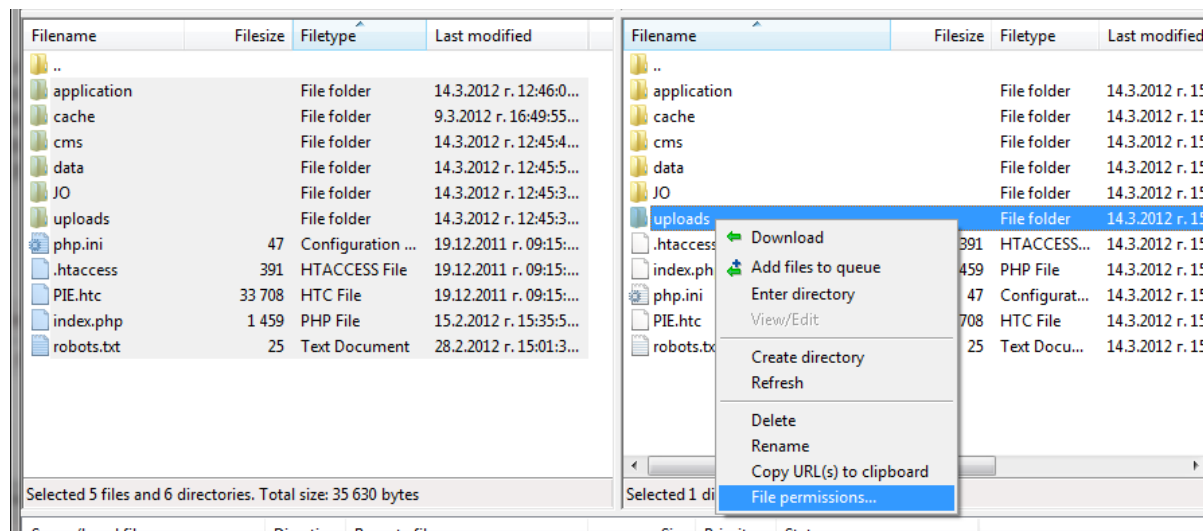

Go to the folder you'd like to have your marketplace installed in, and upload all the files you extracted from the archive to that location **in binary mode**, otherwise the installation will not be successful.
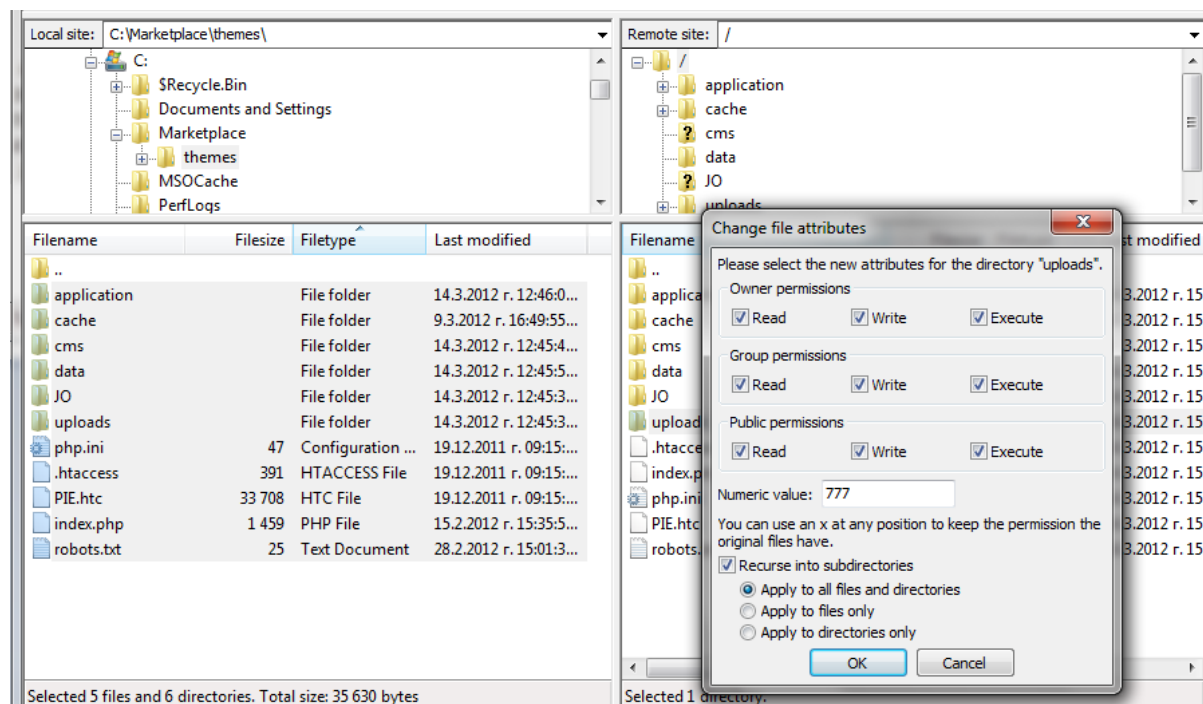

After the entire marketaplce script installation is uploaded to your server, please change the permissions to 777 for the following:

- the **cache** folder;

- the **uploads** folder;

- the **config_db.ini** file, located in the **/application/config/** folder.

Please make sure you check the "Recurse into subdirectories" box when updating permissions for both folders, as this will allow all the files and subfolders to be configurable.

Next type the address of your marketplace in the address bar in your browser.

The configuration page will appear. Please note that the page is identical for all types of marketplaces.

The fields are divided into several groups – **Database configuration**, **Administrator account** and **Demo data**.

Before you enter values in the **Database configuration** fields you need to create the MySQL database, its user and add the user to the database with full privileges. This can also be performed by your hosting provider.
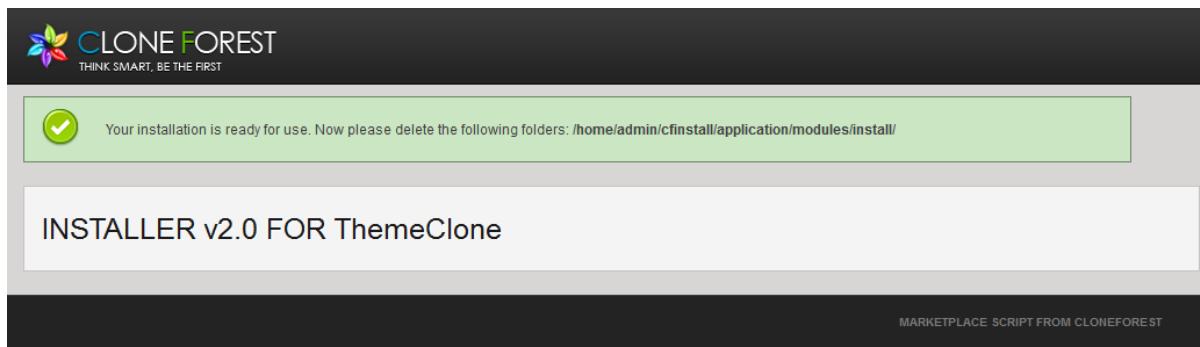

- **Host** – this is the server that holds your database. It will depend on the settings of your hosting provider.

- **User** – the username that you have added to the database.

- **Password** – the DB user's password.

- **DB name** – the name of the database itself.

Filling the **Administrator account** group of fields is required in order the marketplace admin account to be created.

- **Username** – the administrator account's name.

- **Password** – self-explanatory.

- **Admin mail** – all service messages will arrive on this address.

- **Report mail** – an address where all the statistics for the marketplace will be delivered.

Check the **Install demo data** box to some sample files uploaded to your marketplace. When done click **Install**.

If you have completed all the steps as instructed you will see a message, telling you to remove the install directory.

In case the installation script faces a problem you will be notified via an error message.
